

AGENTX HACKATHON

Problem Statements & Expected Solutions

DOMAIN 1: BUSINESS AUTOMATION

1. Customer Onboarding & Relationship Management

Problem Statement

Many organizations struggle to manage new customer onboarding due to scattered customer data, manual follow-ups, and lack of visibility into customer interactions. This results in poor customer experience and weak long-term relationships.

Expected Solution

Participants should build a Salesforce-based CRM that stores customer details, tracks onboarding stages, and maintains interaction history. AgentForce should act as a virtual onboarding assistant to collect information, send reminders, and automatically update onboarding progress.

2. Sales Lead & Opportunity Tracking

Problem Statement

Sales teams often lose potential customers because leads are not followed up on time and opportunity stages are not tracked effectively.

Expected Solution

Develop a Salesforce CRM to manage leads, convert them into opportunities, and track deal progress. AgentForce should remind sales representatives about follow-ups and provide updates on pending leads and opportunities.

3. Vendor & Business Partner Management

Problem Statement

Businesses face difficulties managing vendor information, contracts, and renewals due to manual tracking and poor communication.

Expected Solution

Create a Salesforce system to store vendor data, track contracts, and monitor renewals. AgentForce should notify users about upcoming renewals and allow quick access to vendor status through chat.
